Website Feasibility Study — Arabic / Saudi AI-Content Cleanup

Date: 2026-11-11 **Classification:** a **spike** — a feasibility question whose output is a recommendation, not code to keep or ship. No implementation, no code changes, no commits. **Question:** *Is it worth opening a website targeting the Arabic/Saudi "AI text cleanup" problem, using all the APIs and data we have — and what should it be called?* **Method:** full verification sweep; 3 parallel isolated research subagents (data/API inventory, demand+feasibility, naming) with self-contained briefs; live read-only probes of the repo's **safe** public APIs; independent re-verification of quantitative claims by the coordinating agent. **Frameworks:** `research` (primary sources, single cited Markdown file), `dispatching-parallel-agents`, `brainstorming` (spike path), `evaluating-startup-ideas`, `idea-validation`, `offers`.

⚠ Integrity note

This document obeys the guardrail it describes (`signal_health.py:12-23 INTEGRITY_RULES`). **No market sizes, TAMs, growth rates, conversion rates or buyer counts are stated as fact.** Every number is either (a) computed from repo files with the command shown, (b) quoted from a primary source with a URL, or (c) marked ⚠ `ESTIMATE / unverified`. Banned sales vocabulary is avoided. `UNCLEAR` ≠ compliant (`docs/TOS_AUDIT.md:8`).

Correction to a prior answer: last turn I quoted a "Fractl survey" (8-in-10 workers, median 45 min cleanup, 62% redid a colleague's work, 23% reached customers). Fresh verification found that attribution **unreliable** — those figures trace to *workslop* coverage, not a Fractl survey, and could not be confirmed against a primary source. **They are withdrawn and must not be used in a pitch.** `docs/CONSOLIDATED_STUDY.md:88-95` documents exactly this failure mode in the repo's own published reports.

Executive summary

Question	Answer
Is a full website / SaaS product worth it?	**NO.** Not on directional platform statistics, with zero buyer evidence, against a $5 commodity floor and free humanizer tools.
Is a one-page site worth it?	**YES, conditionally** — strictly as a time-boxed **validation instrument** (a fake door with a real price), not as a product.
Does "we have a lot of data" help?	**NO.** It is ~1.7 MB of legally uncleared Saudi retail listings that this product neither needs nor may lawfully use.
Recommended name	تَنْقِيح | **Tanqih** — "source-checked revision". Tagline: «نردّ كل رقم وادعاء إلى مصدره، ونسلّمك النص مُعلَّماً مع سجل التغييرات.»

The single most important finding is negative but useful: **the customer's-own-document model sidesteps the entire `docs/TOS_AUDIT.md` problem.** The audit concerns licensing of third-party data the project harvests; a text-cleanup service that only processes a document a client voluntarily sends has no source-licensing question at all.

---

1. What the APIs and data actually gave us

Three agents were asked to use the repo's assets. Here is what came back, with verification.

1.1 Local data inventory (re-verified by the coordinating agent)

Command: `python verify_counts.py` (counts files, bytes, JSON top-level list items, SQLite rows, Python lines).

Measure	Verified value
Top-level `.json` files	**8**
Total JSON bytes	**1,824,995 bytes ≈ 1.74 MiB**
Top-level list items across those files	**834** (`haraj_100_gaming_listings` 100 + `jarir_taxonomy_tree` 12 + `stream_data` 722)
SQLite rows (`haraj_market.db`)	**154** (85 `listings` + 69 `price_history`)
Python files / lines	**102** / **8,176**

So "a lot of data" resolves to ≈ **988 structured records** (834 + 154, *INFERRED* record definition) plus ~1.7 MB of raw harvest dumps, GraphQL introspection and category trees. Three of the four published reports are the **same file** byte-identical (`LATEST_IDEAS.md`, `docs/LATEST_IDEAS.md`, `reports/2026-11-11.md` — md5 `b16cb77b52e8`, 42,624 B). The bulk of the repo is code, recon scripts, downloaded JS/HTML bundles and AI-written prose — **not a cleaned dataset**.

1.2 Live read-only API probes (safe sources only)

Deliberately did **not** touch the 7 HIGH-risk sources (`docs/TOS_AUDIT.md §4`). Command: `python probe_apis.py`.

API	Result	Reading
Amazon SA autocomplete (`DATA_EXPANSION_STUDY.md:25`, VERIFIED 200, no key)	محتوى ذكاء اصطناعي → `[]`; تدقيق نصوص → `[]`; تصحيح محتوى → `[]`	**Zero Arabic suggestions.** A negative demand signal from this API — but it is a *product* search, so this is weak evidence, not proof of no demand.
HN Algolia (`docs/TOS_AUDIT.md:28`, risk L)	`AI content audit` nbHits **2,789**; `AI slop cleanup` **638**; `AI humanizer` **498**; `hallucination editing` **76**	Counts of HN stories matching a query — a **weak topical-attention proxy**, NOT market demand or buyers. Do not present as demand.
Salla App Store (repo `salla_client.py`)	**19 categories**, including a first-class الذكاء الاصطناعي category. `q=4` → تدقيق apps (collections, SEO, ops, reporting); `q=15` → محتوى apps (SEO, marketing, loyalty, UGC)	**No AI-content-audit app exists in the merchant app store.** A genuine whitespace signal — but it is an *app store for merchant tools*, not a service marketplace, and "no app" ≠ "no demand".

1.3 Blunt verdict on the data

`docs/TOS_AUDIT.md:8` — **zero sources declared "compliant"**; §4:57 "Do not label any source 'compliant'"; `README.md:77` says so. The MIT `LICENSE` covers repo code only (`docs/TOS_AUDIT.md:69`), granting no third-party data rights. A website built on this scraped data would inherit those rights problems wholesale; `docs/BUSINESS_IDEAS.md:141` already lists "launch the ~22-source commercial data product" as an **anti-idea**.

Technically it is also the wrong data: there is no corpus of Arabic work documents, no AI-tell labels, no tone annotations, no customer records, no Arabic NLP (`requirements.txt` = `google-antigravity`, `httpx`, `python-dotenv`, `beautifulsoup4`; no `camel-tools` / `farasa` / `hazm` / `transformers`). The only transferable asset is the **method**: `signal_health.py:12-23 INTEGRITY_RULES` (forbid invented numbers/terms, require "insufficient data", literal citation) — pure text, network-free, MIT-licensed, zero third-party data. That is a discipline, not a dataset.

---

2. Demand and competition (fresh verification)

Claim	Source	Verdict

Freelancer.com "correct AI / hallucination / error" listings **+87% → 10,760** (Aug 2025–Jun 2026); Upwork remediation gigs **+70% YoY**; Fiverr "AI cleanup" searches **>20×** since 2023	Guardian, Search Engine Journal	**VERIFIED AS REPORTED / DIRECTIONAL** — platform-internal data, explicitly unaudited; the three platforms measure different things and cannot be summed
Four **PwC Middle East** reports with fake footnotes, incl. a hallucinated paper on *air quality in Riyadh* (Jul 2026)	FT, GPTZero	**VERIFIED** — the strongest KSA-specific proof point for a sales conversation
Arabic ≈ **0.5% of web content** (Qatar's Fanar researchers); Saudi/Gulf dialect + register failures; "unlived Arabic"	Fast Company ME	**VERIFIED** — the technical moat is real
"A fast draft is not publish-ready content"; tone before grammar; **PDPL** warning on pasting customer data into public AI tools	Origami.sa (Saudi agency, 11 Jun 2026)	**VERIFIED**
Ipsos/ABG UAE+KSA: **70% concerned** about overreliance without human oversight	Ipsos	**VERIFIED (70%)**; but "112 professionals / 68% / 2026" is **UNVERIFIED** — the page says "100+", 96% used AI tools, dated 30.06.**2025**. ⚠ Survey, not buyer counts
Deloitte "Arab Media in the Age of AI": provenance + human-in-the-loop	Deloitte	**PARTIAL / UNVERIFIED** — the quoted "provenance" wording and "KSA 70%" are not on the public page. Forecast, not buyer counts
The exact service is already sold in Arabic	Khamsat ($5 / 400–500 words), Kafiil ($5), Mostaql (buyer wrote "عدم استخدام الذكاء الاصطناعي", $25–50)	**VERIFIED** — real demand, but at commodity prices
NEW: Khamsat now lists "**AI** تدقيق محتوى" as a category; a buyer request asks for "مراجعة بشرية... أنسنة المحتوى"	`khamsat.com`	**VERIFIED** — the category exists, i.e. demand is organized, not a lone gig
NEW: Arabic AI humanizer/detector SaaS already exists (`aidetector.pro`, `humanifyer.com`, `gptcleanup.com`, Undetectable.ai)	as listed	**VERIFIED** — crowded, and several sell detector *bypass*
Arabic AI-tell word lists are weakly sourced	`content-locale-humanize-ar` skill ("sourcing confidence: the weakest of any language checked")	**VERIFIED** — do not build an automated "AI tell detector"
Disclosure pressure: SDAIA guidance, Google Ads AI-labelling (Jul 2026), Meta/TikTok	Google Ads policy, Eclipse Agency	**VERIFIED** — sell auditing, never hiding

Counter-signal (same Guardian piece): freelancers expect humanizing work to "dry up within five to 10 years as models improve". Demand is real but possibly transient. And the Guardian reports clients **lowball** cleanup work.

---

3. Verdict on the website

(a) Full product / SaaS site — NO

Conditions to reconsider *only*: ≥1 paid invoice from a cold stranger (`docs/BUSINESS_IDEAS.md:155,177`), written data-rights clearance, and a defensible price above the ~$5 commodity floor.

Reasons: 1. `docs/CONSOLIDATED_STUDY.md:27` — 13 clients and a 20-platform research fleet were built **before any**

buyer conversation; `docs/TOS_AUDIT.md:6` — no revenue. A full site repeats that exact mistake. 2. Demand stats are platform-internal and directional, not buyer counts. 3. The service is already commoditized (Khamsat category, $5 gigs, free humanizer SaaS). 4. The only real moat — native Saudi/Gulf register — requires a **human editor**, which is a service, not scalable software (`content-locale-humanize-ar` confirms Arabic tell-lists are unreliable). 5. `docs/BUSINESS_IDEAS.md:29`: the most important conclusion is negative — don't launch on unverified numbers.

(b) One-page fake door / lead-gen site — YES, conditionally

Endorsed by the repo itself: `docs/BUSINESS_IDEAS.md:66` ("one paid 48-hour fake door"), `:159` ("fake door with a real price, zero scrapers"), `:179` (Step 4). Per `idea-validation`, validate demand **before** code; the site is a **measuring device, not a product**.

Conditions: a real stated SAR price; no accounts, no upload storage, no AI processing, no scrapers; the CTA must ask for **money** (paid pilot deposit / pre-product invoice), not an email; pre-declared pass/fail and a time box. **A page with no traffic is a null experiment** — pair it with 20 cold outbound contacts (`docs/BUSINESS_IDEAS.md:176`).

Riskiest assumption and cheapest falsification

Assumption: a KSA/GCC buyer will pay a foreign, no-local-entity provider a premium to clean up their *own* Arabic work documents, repeatedly, instead of a $5 Khamsat/Kafiil gig, a free humanizer, their own LLM, or an in-house editor. This bundles willingness-to-pay, cross-border trust and preference over cheaper substitutes — the repo's #1 ranked assumption (`docs/BUSINESS_IDEAS.md:155`).

Cheapest experiment: 48-hour one-page fake door at a real price + 20 cold outbound contacts + a pre-product invoice/deposit ask for **one hand-edited Wizard-of-Oz document**. **Pass** = ≥1 paid deposit from a stranger. **Fail** = polite interest, email signups or silence → stop. No code, no accounts, no backend.

Business math — ⚠ all ESTIMATE

⚠ `ESTIMATE / unverified`: ⚠ SAR 300 per document audit × ⚠ 2 documents/month × ⚠ 12 months = ⚠ SAR 7,200 ACV × ⚠ 20 retained clients = ⚠ SAR 144,000/yr. **Every input is invented; this is arithmetic, not a forecast.** The repo has zero buyer evidence (`docs/TOS_AUDIT.md:6`). The ⚠ SAR 300 price is the weakest input, given $5 competitors.

---

4. Compliance / decision rule for the website

May touch: only the customer's own document, voluntarily supplied with explicit consent, processed transiently, then deleted.

May not touch: any scraped third-party data — marketplace listings, Reddit / Google Trends / Autocomplete, retailer catalogs, any of the ~22 sources in `docs/TOS_AUDIT.md`.

A customer-owned-document model avoids the audit problem entirely. `docs/TOS_AUDIT.md` concerns licensing of data the project *harvests from third parties*; with no third-party ingestion, the HIGH / UNCLEAR verdicts are irrelevant. This is the same logic as "Claim Ledger": pure text processing of the customer's own draft (`docs/BUSINESS_IDEAS.md:43,129`).

PDPL: if a document holds personal data, Saudi PDPL (SDAIA) applies; Origami.sa warns pasting customer data into public AI tools may violate it. The operator is outside KSA, so cross-border processing is an open question — **confirm with counsel**, not asserted here (`docs/TOS_AUDIT.md:8` is research, not legal advice). **Disclosure:** SDAIA guidance and platform labelling rules push toward disclosure; the service must support it, never evade it.

---

5. Day-one scope (YAGNI) and prohibited claims

Does: one static page with (1) one specific service — "human review of Arabic work documents: invented facts/numbers, wrong Saudi/Gulf register, AI tells"; (2) one real SAR price, one deliverable (annotated doc + change log), one CTA "request a paid pilot"; (3) a plain privacy/disclosure note (what data, where processed, retention/deletion,

no third-party AI tools on your data, "we do not help hide AI use"); (4) email/WhatsApp contact. **No** accounts, login, stored uploads, payment gateway, dashboard, API, detector, scraper or AI processing. Invoice manually.

Must NOT claim: "AI detector", "% AI-written" or any AI score (Arabic detection unreliable); "bypass / undetectable" or any evasion of AI-use disclosure; "100% guaranteed" (use the paid-pilot conditional exit, `docs/BUSINESS_IDEAS.md:96`); any market size / growth / conversion figure as fact; any KSA presence, local entity or local address; any banned sales vocabulary.

---

6. Name: تَنْقِيح | Tanqih

Recommended. Arabic تنقيح = critical revision / refinement of a text (تنقيح النصوص = textual verification). It names the **method**, not the machine; it is one short word, spells unambiguously in Latin, and an obvious-brand screen surfaced no clear collision (⚠ UNVERIFIED, not trademark clearance).

- **Arabic tagline:** «نردّ كل رقم وادعاء إلى مصدره، ونسلّمك النص مُعلَّماً مع سجل التغييرات.»
- **English tagline:** "Every figure and claim traced to its source — delivered as a marked-up redline and a change log."

Runner-up سَنَد / **Sanad** ("documentary evidence") is semantically perfect but the screen found 6+ active Saudi/Gulf "Sanad" brands, two finance entities, Jordan's `sanad.gov.jo` government digital-ID platform and Al Jazeera's Sanad fact-check unit — a trademark risk and a direct hit on the "don't be confused with a government body" constraint.

Rejected: ميزان / Mizan (suspected Meezan Bank + Quranic authority overtones), رصد / Rasd (surveillance/detection register → drifts toward AI-detector framing), تدقيق / Tadqiq (the generic category word buyers already use — cannot be a named offer).

English alternates (use only on the foreign-entity surface): *Sourcebound* (international landing page / email domain), *Redline Audit* (named offer on proposals/invoices), *Claim Ledger* (deliverable title). Saudi-facing copy and Khamsat/Kafiil/Mostaql gig titles stay تنقيح.

Positioning caveat: copy saying «إزالة آثار الذكاء الاصطناعي / إخفاء / تجاوز الكشف / نسبة التوليد» attracts buyers seeking detector evasion. Put the boundary in the FAQ **and** onboarding: «لا نتحقق من نسبة التوليد ولا نساعد على إخفاء استخدام الذكاء الاصطناعي؛ نُدقّق الأرقام والادعاءات ونُوثّق كل تعديل وسببه.» Sell the audit, the redline and the log — never the disappearance.

Pre-commit checklist (all UNVERIFIED — none run): (1) domains `tanqih` across .com/.sa/.com.sa/.co + misspellings + Arabic IDN; (2) SAIP trademark search (Nice 35/41/42) **and** Ministry of Commerce trade-name reservation — these are different; (3) authority collision with SDAIA / ZATCA / MCIT / .gov.sa; (4) seller names, gig titles and slugs on Khamsat, Kafiil, Mostaql, Ureed; (5) handles on X (primary Saudi B2B channel), LinkedIn, Instagram; (6) 2–3 native-Saudi readers say the name + tagline aloud and answer unprompted "what does this do?" — check for Egyptian/Levantine read, stiff literary MSA, religious/legal authority, or "AI detector" read.

---

7. Validation-first sequence (no code until a stranger pays)

Step	Artefact	Pass / fail
1	**20 cold-customer interview notes** — what do you already pay to fix in Arabic work documents?	Pass = repeated, specific, already-paid-for workflow. Fail = polite interest → STOP
2	**One-page fake door** named تنقيح, real SAR price, "request a paid pilot" CTA	Pass = ≥1 paid deposit from a cold stranger. Fail = email signups / silence → STOP
3	**One hand-edited Wizard-of-Oz audit** of a real client document — redline + change log, every number traced	Pass = buyer asks for week 2 AND all figures trace to source. Fail = untraceable claims → STOP
4	**Written rights + disclosure pack** for exactly the data Step 3 used	Pass = written consent + no third-party ingestion. **Only now write code**

8. Limitations & boundaries

- **Compliance verdicts are inherited** from `docs/TOS_AUDIT.md` (research, not legal advice). No new ToS review here.
- **Demand figures are platform-internal, directional and unaudited**; the withdrawn "Fractl" figures must not be reused. HN Algolia `nbHits` and Amazon autocomplete results are weak topical proxies, **not** demand data.
- **All business math is ⚠ ESTIMATE.** Zero customers, invoices, ACV or conversion evidence exists in the repo (`docs/TOS_AUDIT.md:6`).
- **"No AI-content-audit app in Salla App Store" is a whitespace signal, not proof of demand** — an app store for merchant tools ≠ a service marketplace.
- **The name is not cleared.** Domain, SAIP/MoC, board, handle and native-Saudi register checks are all UNVERIFIED and are the user's to run.
- **Arabic fluency is the deciding fork.** The core deliverable requires native/near-native Arabic with Saudi register sensitivity (`Alignerr` Arabic-language-expert role, $40–120/hr remote, requires exactly that). If the operator lacks it, the model becomes an agency with a subcontracted editor — a different, harder business with thinner margin. This study does not assume that question is answered.
- **Why-now is weak:** the red-team study found no dated, primary-source-verified external inflection in the repo; several candidates are headwinds (PA-API 5 dead, X free tier ended Feb 2026).
- **This is a spike** / **recommendation.** No code, tests, files outside `docs/WEBSITE_FEASIBILITY_STUDY.md`, commits or pushes. Live API probes were read-only, on safe sources only, and touched none of the 7 HIGH-risk sources.
